

CITY BITES – SAHIWAL

Merged Project Documentation & Premium Experience Improvement Plan

Combined from the existing project documentation and the premium UI/UX improvement document.

1. Project Overview

City Bites is a Flutter-based food ordering and delivery application designed for Sahiwal. The project provides a customer food-ordering experience with restaurant discovery, menu browsing, food customization, cart management, promotional codes, checkout, order placement, profile features and a separate restaurant-owner role. The project documentation also defines a premium UI/UX direction focused on a Navy Blue and Orange visual identity, stronger discovery, transparent checkout, live order visibility, feedback, reliability and responsive design.

2. Technology Stack and Architecture

- Flutter and Dart for the mobile application.
- flutter_bloc/Cubit for state management.
- Equatable for state comparison.
- Material Design for UI.
- The current implementation uses mock/demo data where a production system would require backend/database integration.
- Reusable widgets/components are used to standardize buttons, cards, text fields, app bars, badges, images, banners, categories and food cards.

3. User Roles

- Customer: browse restaurants and food, select location, view details, customize items, manage cart, apply promo codes, place orders, view profile/history, switch theme and log out.
- Restaurant Owner: a separate role and dashboard route are provided; the production version should support restaurant, menu, availability and order management.
- Role-based interfaces should remain clear and consistent across the application.

4. Common Issues / Common Improvement Areas

The following areas are common or directly connected between both documents. They should be treated as shared priorities when improving the existing project.

Theme and UI consistency: The project already supports theme switching, while the premium document identifies inconsistent visual styling as an issue. Use a shared Navy Blue (#0D1B2A) and Orange (#FF6F00) design system, with soft-white Light Mode and Deep Navy Dark Mode, and apply consistent colors, typography, buttons, cards, spacing and icons throughout the app.

Restaurant and menu discovery: The existing project includes categories, promotional banners, restaurant/menu concepts and home discovery. The improvement plan requires stronger discovery through Featured restaurants in a

horizontal section, All restaurants in a vertical list, categorized menus such as Fast Food and Desi, search and useful filters.

Cart, pricing and checkout: The current cart supports quantity changes, removal, promo codes and pricing. The premium plan requires a clearer checkout breakdown. Show item subtotal, delivery fee, platform fee and final payable amount separately, validate checkout information and provide confirmation feedback.

Order flow and order visibility: The current project supports order placement and confirmation, while the improvement plan extends the journey to visible order stages: Pending, Accepted, Preparing, Out for Delivery and Delivered, with live map tracking during delivery.

Loading, empty and error handling: The current documentation identifies network/API handling as a non-functional requirement and future backend work. The premium plan specifically requires friendly empty states, API/connectivity error states, unavailable-restaurant states and retry actions, plus skeleton/loading states for restaurant, menu, cart and tracking screens.

Forms and validation: Authentication and user flows already exist, while the improvement plan requires clearer field-level validation. Login, signup, address and checkout forms should identify missing or invalid information and explain how to correct it.

Address and delivery information: Location selection is already part of the customer home flow. The improved version should provide a simple address selection/editing process and validate required delivery information before checkout confirmation.

Profile and account management: Profile and account functionality already exists. The improvement plan requires clearer grouping of profile information, saved addresses, order history, preferences and account actions, with stronger section headings and consistent icon containers.

Responsive design and accessibility: The project documentation requires responsive and maintainable UI, while the improvement plan specifically highlights clipping, overflow, small text, insufficient contrast and unclear labels. Screens should adapt to different sizes and maintain readable text and controls.

Restaurant-owner and role-based experience: Both documents recognize the restaurant-owner role. The production version should provide clear role-based interfaces and restaurant management capabilities.

5. Existing Project Features / Items from Project Documentation

- Splash and onboarding.
- Authentication.
- Customer home.
- Categories and promotional banners.
- Food details with add-ons and quantity selection.
- Cart and checkout.
- Profile and order history.
- Theme switching.
- Restaurant-owner portal/dashboard route.
- Reusable components including CustomBadge, CustomAppBar, CustomButton, CustomCard, CustomTextField, ImageLoader, BannerCarousel, CategoryList, FoodItemCard and HomeHeader.
- AuthCubit, HomeCubit, CartCubit, ThemeCubit and SplashCubit.

- Demonstration promo code SAHIWAL30.
- Pricing logic containing subtotal, delivery fee, GST, discount and final total.
- Order confirmation dialog after successful order placement.
- Recommended database entities: Users, Restaurants, Categories, MenuItems, Orders, OrderItems and PromoCodes.

6. Separate Premium UI/UX Improvements

- Premium Navy Blue (#0D1B2A) and Orange (#FF6F00) visual identity.
- Complete onboarding imagery: Burger + Karahi, Delivery Rider, and Wallet + Discount.
- Auto-scrolling promotional/advertisement image carousels.
- Hybrid restaurant discovery with Featured and All Restaurants sections.
- Clear menu architecture with categories such as Fast Food and Desi.
- Post-delivery one-to-five-star rating prompt.
- Use rating data for the Top Rated Near You section.
- Live map tracking during delivery.
- Immediate success/error/confirmation feedback for actions such as Add to Cart and Order Placed.
- Detailed search and filtering with a helpful no-results state.
- Skeleton loading states preserving screen layout while content loads.
- Dedicated friendly states for empty cart, no orders, no results, unavailable restaurants, API failures and connectivity problems.
- Accessibility improvements covering readable text, contrast, labels and understandable controls.
- Consistent responsive behavior preventing text clipping, horizontal overflow and controls extending beyond the screen.

7. Business Logic and Database Expansion

For a complete production system, restaurant and menu data should be centralized instead of relying on hard-coded demonstration data.

- Restaurants should contain owner, name, address/location, contact, image, rating, hours, delivery coverage and status.
- Menu items should contain restaurant, category, title, description, price, image, rating, delivery time and availability.
- Orders should contain user, restaurant, address, totals, status and creation time.
- Order items should store item, quantity, price and add-ons.
- Promo codes should store code, discount, limits, expiry and active status.
- Restaurant owners should be able to add, edit, disable and update menu items.

8. Functional Requirements

- Register and log in users.
- Select a user role.
- Select a Sahiwal delivery location/address.
- Browse restaurants, categories and food.
- Search and filter restaurants/menus.

- View food details and select quantity/add-ons.
- Manage cart items and quantities.
- Apply promo codes.
- View transparent price calculations.
- Validate address and checkout information.
- Place orders and receive confirmation.
- Track order status and, in the enhanced version, live delivery location.
- Rate completed orders.
- View profile, saved addresses and order history.
- Switch Light/Dark theme.
- Log out.
- Support restaurant-owner management workflows in the production version.

9. Non-Functional Requirements

- Responsive interface.
- Maintainable and modular architecture.
- Reusable widgets and Cubit/BLoC state management.
- Secure authentication.
- Reliable data persistence after backend integration.
- Efficient image handling.
- Clear input validation.
- Friendly API/network error handling.
- Readable and accessible interface.
- Consistent UI/UX across all screens.

10. Current Limitations

- Authentication currently uses simulated delays rather than real authentication.
- Food, restaurant and order-history data contain demonstration data.
- Promo-code logic is demonstration-level.
- Payment is not yet implemented.
- Live delivery tracking is not yet implemented.
- Notifications are not yet implemented.
- Persistent backend storage is not yet implemented.

11. Testing Plan

- Authentication and role navigation.
- Category filtering and location selection.
- Restaurant discovery, search and filtering.
- Food details, quantity and add-ons.
- Cart quantity changes and removal.
- Promo codes and price calculations.
- Checkout validation and address handling.

- Order confirmation and order-status flow.
- Live tracking after backend integration.
- Rating and Top Rated Near You functionality.
- Profile, theme and role switching.
- Loading, empty and error states.
- Different screen sizes and responsive behavior.
- Accessibility checks.
- API/database and complete order workflows after backend integration.

12. Recommended Implementation Sequence

1. Premium foundation: Apply Navy Blue and Orange, define Light/Dark modes and establish shared typography, spacing, buttons, cards and icons.
2. Discovery: Complete onboarding imagery, promotional carousels, Featured/All restaurant discovery, search, filtering and categorized menus.
3. Ordering journey: Refine food details, cart cost summaries, checkout validation, address management and action feedback.
4. Order transparency: Add order stages, live map tracking, post-delivery ratings and Top Rated Near You.
5. Product hardening: Add skeleton loading, empty/error/offline states, responsive behavior, accessibility, role-based interfaces and network handling.
6. Backend production phase: Add Firebase or REST API, real authentication, verified Sahiwal restaurants, online payments, restaurant order management, rider module, notifications and persistent data.

13. Future Enhancements

- Firebase or REST API backend.
- Real authentication.
- Verified Sahiwal restaurant directory.
- Online payments.
- Restaurant order management.
- Rider module and live tracking.
- Push notifications.
- Reviews and ratings.
- Favorites.
- Personalized recommendations.
- Admin panel.

14. Final Summary

City Bites has a solid Flutter foundation covering the core customer journey, reusable UI components, role navigation, cart/pricing logic and Cubit-based state management. The merged improvement plan focuses on bringing the existing foundation to a more premium and production-ready level. The highest priorities are a consistent Navy Blue and Orange design system, stronger restaurant/menu discovery, transparent checkout, clear order visibility, reliable loading/error states, validation, responsive accessibility and backend integration. The final goal is a dependable Sahiwal-focused food delivery experience from onboarding through final delivery.
